Abstract

Objective: To analyse economic burden of selected analgesic drugs prescription by dentists in Slovakia over a 24-month period. Material and Methods: In this economic burden study, the data were provided from the largest public health insurance company in Slovakia. It was analysed 23,256 prescriptions of selected analgesic drugs (Acetylsalicylic Acid, Diclofenac, Nimesulide, Tramadol and Metamizole Sodium) by dentists in Slovakia. Results: The highest analgesics prescription by dentists was found in Diclofenac in 2016 with 11.2% prescription increase in 2017. The significant decrease of analgesic drug prescription by dentists in 2017 was observed in Tramadol (−29.9%). The economic burden of selected analgesic drugs by patients were €33,926 in 2017 with 21.3% significant decrease of average percentage differences (APD) in Tramadol and 84.6% significant increase of APD in Metamizole sodium in 2017. Patients participated 65.5% share in payment of selected analgesic drugs and Health Insurance Company participated only 34.5% share in payment of selected analgesic drugs in 2017. It was found increase of percentage analgesic drugs prescription in Diclofenac and Nimesulide and decrease of percentage drug prescription in Metamizole sodium from 1/2016 to 12/2017. Conclusion: Economic burden on analgesic drugs prescribed by dentist was low per Slovak inhabitant in calculated. Diclofenac was most frequent prescribed analgesic drug with the highest economic burden. We recommend prescribing cheaper analgesic drugs with a lower economic burden and with the same effect.

Keywords: Costs and Cost Analysis; Cost of Illness; Drug Prescriptions.
Introduction

Orally effective opioids, acetaminophen, acetylsalicylic acid (aspirin) and non-steroidal anti-inflammatory drugs (NSAIDs) remain the mainstay of analgesic therapy of acute orofacial pain [1]. The current opioid abuse crisis highlights an urgent need for better paradigms for dental education and treatment of acute and chronic pain and addiction [2].

In the world, 69,000 people die in consequence of opioid overdose annual and 15 million population is opioid dependence [3]. 31.0% of dentists prescribe of opioids for patients 10-19y. [4]. Estimating the prevalence, incidence of opioid misuse is challenging, because of variable definitions [5]. NSAIDs and opioid analgesics are often misused as drugs [6-8]. Opioids are the most effective psychoactive substance for the pain treatment and suffering [9]. The adverse effects of opioids are drowsiness, vomiting, nausea, constipation and fatal overdoses [10]. Most opioids prescribed by dentists are associated with surgery [11]. Globally, Tramadol is most consumed opioid in Slovakia [12].

Dental pain is evaluated varied instruments: Dental Pain Questionnaire [13], Oral Health Impact Profile [14] and others. Dental pain is associated with worse socioeconomic status [15] and it is one of the most frequent dental discomforts [16].

The total economic burden of prescription opioids abuse, fatal overdose and dependence are estimated to be $78.5 billion in USA in 2013 [17]. There is a limited number of economic burden studies analysing of analgesic drugs prescription by dentists.

The aim of this study was economic burden analyse of selected analgesic drugs prescription by dentists in Slovakia over a 24-month period.

Material and Methods

Study Design

In this economic burden study, the data were provided from the largest public health insurance company in Slovakia.

It was analysed 23,256 prescription of selected analgesic drugs by dentists in Slovakia. Selected drugs were: Acetylsalicylic Acid, Diclofenac, Nimesulide, Metamizole Sodium (NSAIDs) and weak opioid Tramadol.

Statistical Analysis

The statistical analyse of proportion, average percentage differences (APD) and economic burden of selected analgesic drugs prescription by dentists was evaluated by IBM SPSS Statistics for Windows Software, version 24 (IBM Corp., Armonk, NY, USA).

The average percentage differences (APD) was calculate based on share number on equation:

\[ APD = \frac{n_1 \times 100}{n_2 - 100}, \]

where, \( n_1 \) is number analgesic drugs prescription in 2017 and \( n_2 \) is number analgesic drugs prescription in 2016.
Results

The selected analgesic drugs prescription by dentists in Slovakia and APD, 2016-2017 can be seen in the Table 1. The highest analgesic drug prescription by dentists was found in Diclofenac in 2016 with 11.2% prescription increase in 2017. The significant decrease of analgesic drug prescription by dentists in 2017 was observed in Tramadol (-29.9%).

1Average percentage differences; *p<0.05.

The economic burden of selected analgesic drugs by patients were €33,926 in 2017 with 21.3% significant decrease of APD in Tramadol and 84.6% significant increase of APD in Metamizole sodium in 2017. The economic burden of selected analgesic drugs by health insurance company were €17,862 in 2017 with significant decrease of APD in Acetylsalicylic acid (-33.3%), Tramadol (-34.2%) and Metamizole sodium (-36.4%) in 2017. Patients participated 65.5% share in payment of selected opioids and health insurance company participated only 34.5% share in payment of selected analgesic drugs in 2017.

It was found increase of percentage analgesic drugs prescription in Diclofenac and Nimesulide and decrease of percentage opioids prescription in Metamizole sodium from 1/2016 to 12/2017 (Figure 1).
Discussion

Acetylsalicylic acid (aspirin) is one from the analysed analgesic drugs which is available as over-the-counter (OTC) drug (without prescribing by a doctor) in Slovakia. All specialized doctors prescribed 1,561,486 packages (0.29 package per capita) of acetylsalicylic acid and without prescribing by a doctor it was bought 1,234,267 packs (0.23 package per capita) in Slovakia in 2017 [18]. In our study, acetylsalicylic acid was prescribed only 94 packages by dentists. It can be partly explained that acetylsalicylic acid is often self-medicate with OTC drugs in Slovakia and lower use compared with that the newer NSAIDs in clinical practice in patients suffering from dental pain.

Diclofenac was prescribed 524,644 packages by all specialized doctors (0.10 package per capita) in Slovakia in 2017 [18]. The highest analgesics prescription with the highest price of one pack (payment by patients: €3.54 per package) was found in Diclofenac by dentists. It can be partly explained that diclofenac is a wide proven and commonly prescribed analgesic drug with anti-inflammatory and antipyretic properties and extensive research shows that the diclofenac pharmacological activity includes action novel mechanisms [19].

In a previous study it was found association between increased risk of liver toxicity and Nimesulide [20] nevertheless in our study it was observed high Nimesulide prescription (22.1%) with high price of one pack (payment by patients: €3.47 per pack) by dentists in 2017.

In economic burden study [21] which analysed selected opioids prescribed by dentists in Brazil, it was found that expenditure share of Tramadol prescribed by dentist was 12.4%. These results are not corresponding with our study where expenditure share of Tramadol prescribed by dentist was 6.0% in 2017. It can be explained different demographic and cultural factors in pain therapy what it was confirmed in a previous study [22].

It was observed the highest the average percentage differences of payment by patients in Metamizole sodium, in spite of the decrease average percentage differences of payment by health insurance company in Metamizole sodium in 2017.

Figure 1. The percentage of selected analgesic drugs prescription by dentists in Slovakia from 1/2016 to 12/2017 (n=23,256).
Conclusion

Economic burden on selected analgesic drugs prescribed by dentists was low per Slovak inhabitant in calculated. Diclofenac was most frequent prescribed analgesic drug with the highest economic burden. We recommend prescribing cheaper analgesics with a lower economic burden and with the same therapeutic effect.
